

DC inverter model

Overview

The inverter model simulates the conversion of DC electrical input—derived from PV module IV curves—into AC output suitable for grid connection. The form of the model is as follows: $P_{AC} = \{P_{AC0} A B C (A B)\} (P_{DC} B) + C (P_{DC} B)^2 A = P_{DC} C_0 \{1 + C_1 (V_{DC} V_{DC}^0)\}$, $B = P_{s0} \{1 + C_2 (V_{DC} V_{DC}^0)\}$, and $C = C_0 \{1 + C_3 (V_{DC} V_{DC}^0)\}$. Modern electronics and renewable energy systems depend on DC to AC inverters that convert a DC source into a clean sinusoidal AC output. Convert DC power and voltage to AC power using Sandia's Grid-Connected PV Inverter model.
