

Direct drive full power wind power generation system

Overview

Permanent magnet direct-drive (PMDD) turbine generators avoid rotor winding losses and mechanical energy losses associated with gearboxes and couplings. The full power converter provides the flexibility to optimize rotor rotational speed for maximum mechanical energy. Direct-drive permanent magnet synchronous wind power systems, characterized by their simple structure and high reliability, have gradually become the mainstream in wind power systems. This setup eliminates the traditional gearbox that converts the rotor's low-speed rotation to the high-speed rotation required by the generator. In response to the development needs of high proportion wind power bases in northwest China, northern Shandong and other regions, as well as the strong fluctuation characteristics of wind power, this paper establishes a theoretical analysis model for permanent magnet direct drive wind power bases.
