

# Energy storage power stations require spacing

## Overview

---

5 of NFPA 855, we learn that individual ESS units shall be separated from each other by a minimum of three feet unless smaller separation distances are documented to be adequate and approved by the authority having jurisdiction (AHJ) based on large-scale fire testing. • Fire safety spacing should comply with the High Voltage Power Distribution Device Design Standard (DL/T 5352-2018). • If required spacing is not met, firewalls can be installed to ensure adequate fire separation. • Perimeter walls, gates, and internal roads should facilitate emergency access. NFPA 855 sets the rules in residential settings for each energy storage unit—how many kWh you can have per unit and the spacing requirements between those units. Do not install anything inside the required clearance above. ility and keeping electric-ity costs low. Energy storage can mitigate the impact of power outages by providing backup power during emergencies, support an efficient and cost-effective energy system, and ensure broade storage facilities in the United States.

## Energy storage power stations require spacing

### Essential Safety Distances for Large-Scale Energy Storage Power Stations

Discover the key safety distance requirements for large-scale energy storage power stations. Learn about safe layouts, fire protection measures, and optimal equipment spacing to ...
