

How high is the utilization rate of solar power generation

Overview

As of 2023, solar energy was the world's third-largest renewable energy technology, behind wind and hydropower — nearly 5.5% of global electricity generation came from solar energy in the first half of 2023, most commonly from solar photovoltaics (PV). The electric power sector totaled about 4,260 billion kilowatthours (BkWh) in 2025. In our latest Short-Term Energy Outlook (STEO), we expect U.S. solar to reach 6% in 2027, when it reaches an annual total of 4,423 BkWh. Solar energy can be harnessed two primary ways: photovoltaics (PVs) are semiconductors that generate electricity directly from sunlight, while solar thermal technologies use sunlight to heat water for domestic uses, to warm buildings, or heat fluids to drive electricity-generating turbines. What is the utilization rate of solar panels in the United States?

1. Global solar photovoltaic capacity has grown from around 40 gigawatts in 2010 to approximately 2.
