

Large solar panels solar on-site energy storage

Overview

Because there is a predictability to the schedule of solar energy production, a battery can store excess energy produced during the day and then distribute that energy overnight when the grid would otherwise have to use electricity produced using fossil fuel. Installing on-site renewable energy systems is a common strategy facility owners can use to save money, reduce their greenhouse gas emissions, and add resiliency to their facilities by generating their own electricity. Many facilities have recognized the advantages of on-site renewable energy. Utility-scale energy storage (often through batteries) is usually paired with utility-scale renewable energy projects, so let's talk about those first. Utility-scale solar installations are much larger than residential or even commercial arrays (often measured using MW instead of KW), and usually. Known as distributed generation or on-site power generation, this approach allows organizations to offset grid costs, manage peak demand, and gain greater energy independence. From solar panels and combined heat and power (CHP) systems to advanced battery energy storage systems, on-site solutions.
