

The snow on the photovoltaic panels melted and smoke came out

Overview

When snow melts due to warmer temperatures or the heat generated by the panels themselves, the water can seep into small crevices or gaps in the panel's surface. If the water refreezes when temperatures drop again, it can expand, potentially causing solar panel snow. Do I need to remove snow from my solar panels?

And if so, what's the easiest way to do it?

The short answer: In most cases, you don't need to do anything at all. And when snow does become a problem, the easiest way to automatically remove snow on solar panels isn't a rake or a gadget; it's smart. This raises common concerns about solar panels and snow removal in regions with long, snowy winters. While snow can temporarily reduce output, its impact is often smaller than expected. During the winter, an array depends on light hitting the PV cells in each panel. This can potentially lead to solar panel snow damage.
