

Under what circumstances can the battery of a communication base station be measured at 55c

Overview

We find that the working condition degradation of a battery group may be accelerated under various situations and can cause premature failures on batteries in the group, which can hardly be captured by nowadays maintenance procedure and easily lead to a power-outage-triggered. We find that the working condition degradation of a battery group may be accelerated under various situations and can cause premature failures on batteries in the group, which can hardly be captured by nowadays maintenance procedure and easily lead to a power-outage-triggered. These factors collectively make communication batteries for base stations a highly specialized and mission-critical component. The unique operational conditions of telecom base stations require batteries with characteristics distinct from general-purpose or consumer-grade products. Selecting the right backup battery is crucial for network stability and efficiency. Key Requirements: Capacity & Runtime: The battery should provide sufficient energy storage to cover potential power. In the communication power supply field, base station interruptions may occur due to sudden natural disasters or unstable power supplies.
