

# What is the heat dissipation of solar inverters

CE UN38.3 MSDS

## Overview

---

Solar inverters do get hot as any electrical device that utilizes electricity in any way will emit heat, and the solar inverter is no different. It converts current from DC to AC and transmits that to the house for use; some of the energy is released as heat and dissipated via heat. SolarEdge inverters are designed to be installed in indoor and outdoor locations. One of the key challenges in maintaining the efficiency and longevity of inverters is managing heat dissipation effectively.
