

Which domestic airports have installed photovoltaic panels

Overview

As of mid-2023, over 44 airports across the country have transitioned to 100% renewable energy for their operations, and the target is to make more than 121 airports carbon-neutral by the end of 2025. With large expanses of unused or underutilized land around runways and taxiways, airports can install solar farms without impacting air traffic. Around 20% of public airports in the U.S. are already using solar energy. Environmentally, solar energy shows a commitment to sustainability. Solar installations at airports serve multiple purposes: they reduce operational costs, provide energy independence, and demonstrate a commitment to sustainability. The transformation is already underway. A 7-megawatt expansion is expected to go live in 2027.
