

# Which season has the strongest wind

## Overview

---

During winter, wind speeds tend to increase due to the greater temperature contrast between the poles and the equator, resulting in stronger pressure systems. Nationally, wind plant performance tends to be highest during the spring and lowest during the mid- to late summer, while performance during the winter (November through February) is around. A frontal system is expected to bring showers and thunderstorms along the Gulf Coast and Southeast, and some snow and/or freezing rain/drizzle over the southern Mid-Atlantic into the morning. March is a transitional month that serves as a bridge between winter and spring.
